Dynamic Pages Overview

You created all necessary backend services (Django views and API endpoints) for managing dealerships, reviews, and cars in the last module. Next, it is time to create some stylized front-end REACT pages to present those service results to the end users. In this learning module, you need to perform the following tasks to add the front-end to the app:

- Create a Dealers component to list all the dealers
- Create a dealer details component that will show the reviews for that particular dealer
- Create a review submission page

Follow the instructional lab to complete the above tasks step by step.
